Dell Online Assessment (OA) - IIT Dhanbad

Assessment Overview

Role	Graduate Intern (Intern + Confirmed FTE opportunity)
Duration	1 Hour
Format	IDE-based debugging with Integrated AI (Claude). Available modes: Plan, Agent, and Ask.
Task	Candidates were required to write prompts for Claude to fix errors in existing repositories and pass the failing test cases.

Question 1: RAG Application Debugging

Description: A Retrieval-Augmented Generation (RAG) based application.

Task: The repository contained 2 Python files with errors. The candidate had to solve the errors in both files and pass all test cases using the provided AI assistant.

Question 2: Django Promo Code Validation

Context: The "ShowPass" event ticketing platform currently supports fundamental ticketing operations such as creating/managing venues, managing event lifecycles, tracking seat inventory, and processing orders, payments, and promo codes.

The Issue: The platform supports promo codes that give discounts on ticket purchases. However, promo codes are being accepted even when they should be rejected. Promo codes meant for one event work on any event, and codes past their usage limit keep getting redeemed.

Task

Fix the promo code validation so that:

- **Deleted codes are rejected:** Promo codes that have been deleted should not be found or accepted.
- **Date validation:** Reject codes that are not yet active (before their start date) or have already expired (past their end date).
- **Usage limits:** Reject codes that have already been used the maximum number of times.
- **Event restrictions:** Event-specific promo codes should only work for that assigned event. Reject them whenever referenced in a different event.
- **Minimum quantity:** Enforce the minimum ticket quantity before allowing a promo code to be applied.

Detailed response structures, validation rules, and edge-case handling are provided in the accompanying test cases.

Notes Provided

- For API documentation, refer to the Swagger docs available at the `/api-docs` endpoint when the server is running.
- To understand the overall architecture, refer to the document located at `docs/architecture.md`.
- To make API testing easier, the repository includes helper curl scripts under the `curl_scripts/` directory. These scripts handle authentication, event setup, promo code creation, and order placement.
