WARNER MUSIC GROUP (WMG)

Online Assessment Reconstruction — IIT Dhanbad Drive

Section 1: Core Fundamentals

30 Questions

Multiple Choice Questions (MCQ) | Negative Marking Applied

The first section assessed broad computer science knowledge through multiple-choice questions. **Note: This section included negative marking for incorrect answers.** Topics included:

- **CS Fundamentals:** General theoretical concepts.
- **Pseudo-code:** Tracing and determining the output of provided pseudo-code algorithms.
- **SQL:** Theoretical and syntax-based database questions.

Section 2: Database Management

1 Question

SQL Query | Joins | Aggregations | Window Functions

Candidates were required to write a comprehensive SQL query interacting with two provided tables:

Table 1: Tracks

```
- Artists
- Song IDs
```

Table 2: Metrics

```
- Artists
- Various Scores
```

Task Requirements:

- Join the two tables correctly based on the artist entity.
- Perform aggregations to compute scores for the artists.
- Utilize `CASE WHEN` (switch case) statements to classify artists into distinct categories based on specific score ranges.

Section 3: Data Structures & Algorithms

1 Question

Strings | Maps / Dictionaries | Implementation

Candidates were provided with an array of string logs representing track data. The core task was to parse these strings, aggregate scores, and determine the top track based on specific criteria.

```
Log Format: "TrackName@score"
```

Implementation Rules & Constraints:

- **Parsing & Aggregation:** Parse the string, extract the score, and continuously accumulate the scores for the respective track names. Scores can be negative.
- **Validation Filter:** Ignore invalid logs. A log is invalid if:
  – It is missing the @ symbol.
  – The score is non-numeric (e.g., `"TrackName@abc"`).
  – The score is missing entirely.
- **Threshold:** To be eligible for the result, a track must appear in **at least 3 valid logs**.
- **Return Value:** Return the highest-scoring track that meets the threshold.
- **Tie-breaker:** If there is a tie for the highest score, return the lexicographically smallest track name among the tied tracks.
