QUESTION: 5 GROUP: Problem Solving Test SECTION: Section A Mark(s): 1
TIME LEFT: 00:
Consider an online company that offers streaming of Movie videos directly to home over broadband internet in Manhattan. Let's assume the population of Manhattan is 1.5 million and 2/3rd
households have internet access.
Consider the following data:
- There is an average of 2 people per household in Manhattan
- Of the current Manhattan households with Internet access, 10% have expressed an interest in an online movie streaming, and we expect that number to grow 10% a year for the next two years
- You can assume for now that the number of households that have internet access does not increase and total population also does not increase
Question: Interested households currently watch 1 movie a month from other channels/sources. They are expected to watch only 8 movies a year in two years' time. Given this data, what the percentage decrease in the total number of movies streamed, from interested households two years from now?
33.33%
20.33%
18.00%
19.33%
