HirePro Assessment — Short Prompt Continuation

Type this after the text you have already entered:

Calculations: Use long long. scaled = amount * (100 + tax_percent). Sum scaled amounts for APPROVED and PENDING invoices separately. Count late APPROVED invoices and PENDING invoices linked to CRITICAL orders. total_limit_scaled = 100 * sum of valid order limits. overspend = max(0, approved_scaled - total_limit_scaled).

Risk score: risk = overspend + 5000*late_count + pending_scaled/10 + 1000*(6-rating) + 3000*critical_pending_count. Use integer division. REJECTED invoices contribute nothing.

A supplier is eligible only if valid, active, and has at least one APPROVED or PENDING invoice. Sort by risk descending, approved_scaled descending, then supplier_id ascending.

Print at most K lines: supplier_id risk_score approved_scaled pending_scaled late_count. Use single spaces and no labels. Print NA if none qualify. Handle edge cases efficiently and output no extra text.

Note: This PDF contains the short continuation only, since you said you have already typed the first part of the prompt.
